

Lost Transactions, Lost Revenue? Deploy a Lower Latency Solution.

Ensuring superior low latency for financial information exchange (FIX) trading

Time is money, and never has this statement been more true than in the realm of high-frequency trading. Here, where even microseconds (μs) determine the success and profitability of trades, the value of low latency is unparalleled. Existing latency can be low, but it is not good enough. A10 low latency solutions ensure your advantage.

In the financial world, fractions of a second matter. Sluggish infrastructure and poor application performance can make the difference between material gains and losses.

Case Studies:

Case 1:

Fortune 50 financial institution achieves ultra-fast trade execution and real-time market responsiveness by deploying A10's low latency solution to achieve trading speeds $<2\mu\text{s}$.

Case 2:

A multinational investment bank managing trillions in assets reduced latency by ~50%. Existing configurations were seamlessly migrated without disruption, demonstrating significantly lower latency compared to other vendors in customer-led tests.

The A10 Solution Advantage

- Lower latency = more successful trades, more revenue
- Deliver substantially lower latency (less than $2\mu\text{s}$) for high frequency trading (HFT) transactions using FIX
- Easy to deploy, operate, and manage
- Reduce cost and latency by consolidating several network services into a single A10 solution
- Support TLS encryption for FIX/ETI to meet upcoming financial exchange requirements
